— A — SEVERITY RUBRIC

TIER	DEFINITION
CRITICAL	Direct loss of user funds or full protocol takeover with no meaningful preconditions. Reachable from a permissionless instruction by any signer. Must be patched immediately.
HIGH	Significant loss of user funds or protocol invariant violation under realistic preconditions (specific market state, signer with limited but obtainable role). Patch should ship in next release.
MEDIUM	Hardening issue, partial loss possible, or invariant violation requiring privileged signer or improbable state. Worth fixing in normal cadence.
LOW	Minor issue with no plausible path to fund loss. Code-quality or defense-in-depth concern.
INFO	Informational. No security impact. Documentation or style suggestion.

— B — METHODOLOGY

This cycle was produced by Jelleo's continuous, hypothesis-driven Solana audit loop. Every finding originates as a falsifiable invariant claim from a per-protocol hypothesis library, dispatched to multi-agent recon (Layer 1), promoted on contested verdicts via adversarial debate (Layer 1.5), and confirmed empirically via a `cargo test` proof-of-concept (Layer 2) before transitioning to `confirmed`. Confirmed findings auto-fire structural sibling derivation and cross-protocol propagation hooks, then move through a restricted lifecycle (`new` → `triaged` → `confirmed` → `disclosed` → `fixed` → `verified`). Every cycle is signed Ed25519 against the platform key — see the cover-page receipt.
